

Vantage Hosted Network Monitoring

- Real-time and historical network performance and usage reporting
- Traffic utilization analysis
- Services and servers resource inventories
- Network latency and packet loss measurements
- Early warning degradation alerting
- Problem detection and notification
- Host- and service-based monitoring
- Protocol analysis and classification
- Automation network device backup and logging
- Interface monitoring
- Intuitive, web-based access
- Low subscription and operating costs
- No additional hardware or training
- Two subscription options tailored to the size and needs of your business

Comprehensive and Proactive Monitoring

IPNETZONE's Vantage Hosted Monitoring Solutions

Vantage Monitoring is a suite of enterprise-class network monitoring applications that track and report the health of your network and peripheral devices, helping you make critical decisions and address potential trouble spots before they affect your business.

Vantage Monitoring Offers Realtime Views Of:

- Traffic/usage on your network, including searchable trend reports, trend projection and thresholding, in which IPNETZONE analyzes your total network capacity and alerting you when approaching a limit;
- Host and service performance and efficiency, so you can be confident that your routers, switches, and firewalls and hosted services are working optimally;
- Network latency, jitter and packet loss analysis, pinpointing single points of failure or bottlenecks.

Vantage Monitoring Also Includes:

- A static blueprint of your entire network and each of its connections, to help your team or IPNETZONE make changes and troubleshoot more efficiently;
- Automated device backup monitoring and logging of every change to your network configurations;
- Centralized SysLog, a daily, consolidated, searchable log of the configurations for each endpoint, including user-accessed devices;
- You, your staff, and/or IPNETZONE's engineers will be auto-notified via email, voicemail, or pager whenever one of your network devices or systems nears a critical threshold or experiences an outage.

Low Installation and Operating Cost

Synthesizing and building upon top-flight open-source monitoring applications, Vantage Monitoring achieves a level of functionality comparable to the most expensive software available, at significantly lower cost.

Furthermore, IPNETZONE monitors your network from a hosted environment, so your activation and operational costs are low. You incur no hardware or personnel costs, and you don't even lose space in your LAN room.

Ease of Use

Despite the broad array of functions and applications it integrates, Vantage Monitoring is managed through an elegantly simple interface.

- Intuitive single-authentication, web-based console, searching capacity and reporting;
- Easy to install, learn, and customize;
- Readily adaptable and scalable to meet changing monitoring needs of even the most rapidly growing company.

For Small- to Medium-Sized Businesses

If you own a small business, you know that your time and your resources are best devoted to honing your competitive edge, not managing your network. That's why IPNETZONE offers Vantage Monitoring, tailored especially to meet the needs of businesses with 50 employees or fewer. With this fully managed, hosted monitoring service, IPNETZONE's expert engineers continually observe your network, and perform off-site support as soon as the need for it arises, often before you are even aware that there is a problem.

For Carriers/Enterprise-Level Businesses:

For businesses with more than 50 users, IPNETZONE offers Unmanaged Hosted Monitoring. We'll equip your team to gain full insight into your network's current, historical and projected availability and performance. Our intuitive interface means that your network administrators can start keeping abreast of your network almost immediately, without expending time and money learning a series of complex applications or extensive command-line programming. And they can create customized, automated policies and scripts to address low-level problems remotely without having to deploy team members to the site premises. For more complex network engineering and higher-level network management requirements, IPNETZONE engineers can

About IPNETZONE

IPNETZONE provides nationwide data and Internet services, managed network services, and network monitoring solutions to other carriers, small- to medium-sized companies and enterprise clients.

Founded in 2007, IPNETZONE has provided Internet circuits ranging from business class cable to gigabit metro ethernet circuits nationwide as well as a full suite of converged IP communications products and network management solutions.

Companies have looked to IPNETZONE for complete solutions to manage their communications infrastructure and shift the burden of maintaining complex networks to a seasoned technology partner.
